The development of the human papillomavirus (HPV) vaccine is a remarkable achievement in the history of public health. Currently licensed HPV vaccines protect against two oncogenic HPV types, the types responsible for virtually all cervical cancers. In addition, a quadrivalent vaccine, which protects against the 2 most common genotypes, types 6 and 11, will be available in 2006. The rate of development has been rapid and the vaccine was approved by the Food and Drug Administration in June 2006, after 12 years of research and a total cost of \$3.5 billion. Future work will include the development of next-generation vaccines and the investigation of improved vaccination strategies.1. Field of the Invention The present invention relates to a liquid crystal display (LCD), and more
