

Category:Hydraulics I upgraded my Brother MFC-J725W from 1.0 to 1.4. I am no linux expert but using your method I installed the 1.4 driver in the regular install and found no upgrade. I checked my Device Manager and it still shows 1.0. Since I cannot seem to get an upgrade out of the box I have uninstalled driver for 1.0 and installed 1.4. The problem is that now I can no longer print my first page and have to print twice. I also checked the file installed.mdeb and it shows my 1.4 driver, so not sure why when using your method it is not working. Any ideas, thanks in advance. Is this the method you want to use? If yes... I can not recommend this. It works, yes. Just do not know how to fix the issues after you go through this whole proces. Maybe it would be easier to start over. This is my post on this issue. Pristina, That is the method I used, but I don't think this will fix my problem. I never was able to get the printer to print in the first place. I did try the method in the first post and using the following command: `#install.mdeb --temp=q --remove=src --set=install` where it shows that the driver I want to replace is installed (post2). I could not figure out what to do from there. Although it worked, the problem was it removed the driver I wanted to install, it was not added.

Right, but I have to print two times now and usually have not problems when printing normally. // Copyright 2017 Yahoo Holdings. Licensed under the terms of the Apache 2.0 license.
